EDUCATION

Ph.D. Indian Institute of Space Science and Technology, [2012 – 2018]

Research Area: Complex networks, computer networks, and communication networks

Thesis: On the evolution of finite sized complex networks

Advisor: Prof. B. S. Manoj

Date of Graduation: May 2018 (more than 5 years full-time)

M.E. Electronics and Communication Engineering. Birla Institute of Technology Mesra, [2010 – 2012]

Specialization: Wireless Communication

Thesis: Capacity enhancement in indoor wireless communication systems

Advisor: Dr. Sanjay Kumar

Date of Graduation: July 2012 (2 years full-time)

B.Tech. Electronics and Communication Engineering. Maulana Abul Kalam Azad University of Technology [Formerly West Bengal University of Technology], [2003 – 2007]

Institute: College of Engineering & Management, Kolaghat, West Bengal, India

Project: Design and development of code for radiation pattern measurement of microstrip antenna

Advisor: Dr. Debendra Kumar Panda

Date of Graduation: August 2007 (4 years full-time)

Higher Secondary (XIIth). West Bengal Council of Higher Secondary Education, [2001 – 2003]

School: Siliguri Boys' High School, Dist. Darjeeling, West Bengal, India

Discipline: Science

Madhyamik (Xth). West Bengal Board of Secondary Education, [1999 – 2001]

School: Siliguri Boys' High School, Dist. Darjeeling, West Bengal, India

PROFESSIONAL EXPERIENCES

Postdoctoral Scholar, [Jul. 2021 – Present]

Qualcomm Institute - UC San Diego Division of Calit2, UC San Diego

Visiting Research Collaborator, [Mar. 2021 – Jun. 2021]

Systems and Networks Lab, Department of Avionics, Indian Institute of Space Science and Technology

Senior Project Officer, [Dec. 2020 – Feb. 2021]

Department of Computer Science and Engineering, Indian Institute of Technology Madras

Institute Post Doctoral Fellow, [Aug. 2018 – Nov. 2020]

Department of Computer Science and Engineering, Indian Institute of Technology Madras

Senior Project Fellow, [Aug. 2017 – Aug. 2018]

Department of Avionics, Indian Institute of Space Science and Technology

Teaching Assistant, [Aug. 2012 – Jul. 2017]

Department of Avionics, Indian Institute of Space Science and Technology

◊ Digital Communication Laboratory (AV332).

- ◇ Computer Networks Laboratory (AV341).
- ◇ Wireless Mesh Networks Course (AV484).

Teaching Assistant, [Aug. 2011 – Jun. 2012]

Department of Electronics and Communication Engineering, Birla Institute of Technology Mesra

- ◇ Digital Electronics Laboratory (EC4102).
- ◇ Wireless Communication and Networking Laboratory (EC7102).

Programmer Analyst, [Dec. 2007 – Jul. 2009]

Cognizant, Inc., Kolkata, India

Industrial Training, [Jun. 2006 – Jul. 2006]

Netaji Subhas Chandra Bose Telecom Training Centre, Kalyani, India

Industrial Training, [Jun. 2005 – Jul. 2005]

Bharat Sanchar Nigam Limited, Siliguri Zone, India

PROFESSIONAL RESEARCH EXPERIENCE

Postdoctoral Scholar. UC San Diego, [Jul. 2021 – Present]

Research Objectives: Designing *de novo* next-generation wireless networks for newly released citizens broadband radio service spectrum

The cloud-based centralized Spectrum Access System (SAS) administrator in the recently released incumbent-dominated Citizens Broadband Radio Service (CBRS) shared spectrum often obfuscates the available spectrum information and revokes CBRS communication rights without prior information from the auctioned Primary Access License (PAL) and unlicensed General Authorized Access (GAA) users to protect the incumbents' location details and their movements. As a result, the communication reliability of the non-incumbents (i.e., PAL and GAA) gets affected by the current policy frameworks concerning only aggregate interference mitigation using the environmental sensing capability networks to protect the incumbents, and no existing solutions exist to address the issue.

In this work, we study the communication reliability for non-incumbents and the socioeconomic impacts of the shared spectrum of CBRS. In particular, our research work mainly focuses on the following avenues: (i) Study the communication reliability of the GAA CBRS Devices (CBSDs) near the incumbent-dominated regions, such as San Diego, (ii) introspect SAS administrator's spectrum obfuscation strategy for safeguarding incumbents' location privacy, and (iii) develop SAS-curated CBRS shared spectrum allocation policies to efficiently manage the coexistence of multiple service providers in a crowded service region with multiple PAL licenses and GAA infrastructures.

Institute Post Doctoral Fellow & Senior Project Officer. Indian Institute of Technology Madras, [Aug. 2018 – Feb. 2021]

Research Objectives: Architecture and protocol solutions to enhance the QoS of next-generation networks: A complex network analysis-based approach

We worked towards developing new architecture and protocol solutions to enhance the next-generation networks' quality of service (QoS). Our proposed solutions also satisfied the diverse network-related stringent requirements in the context of upcoming 5G network specifications. In particular, our research works mainly focused on the novel design proposals for the next-generation networks which include the following: (i) delay-optimized design of industrial machine-to-machine networks, (ii) deployment of a few edge servers at the identified influential base stations to reduce the end-to-end transmission delay in cellular networks, (iii) efficient and reliable deployment of service function chains for latency-critical services, (iv) optimal and reliable allocation of virtual monitoring functions for better monitoring and decision-making purposes, (v) latency-aware and reliable placement of virtual network functions at the 5G edge cloud, and (vi) the orchestration of QoS-aware network slices using multi-connectivity in the 5G edge cloud.

Senior Project Fellow. Indian Institute of Space Science and Technology, [Aug. 2017 – Aug. 2018]

Research Objectives: Research and development of an integrated enterprise network security system

We worked towards designing a novel distributed integrated enterprise network security system framework, considering different elements of a typical enterprise network system. In particular, a novel API call transition matrix (API-CTM)-based malware detection technique was developed, using complex network analysis, that can efficiently detect malware attacks based on a system's runtime behavior. Recent threats such as polymorphic and metamorphic malware, which are difficult to identify with the existing detection techniques (e.g., signature-based detection), can be efficiently identified with API-CTM. Our proposed complex network analysis-based malware detection technique can find applications in the design of real-time malware detection systems when an enterprise network security system is considered.

ACADEMIC RESEARCH EXPERIENCES

Ph.D. Thesis. Indian Institute of Space Science and Technology, [Aug. 2012 – May 2018]

Title: On the evolution of finite sized complex networks

Any complex physical system, man-made or natural, consists of entities interacting with other entities in the system. Such complex systems can be modeled as network graphs where the entities are nodes and their interactions are edges of the network graph. Earlier studies reported the possible mechanisms for the evolution of complex networks where the size of the network is growing, in the context of nodes and edges, with time. However, the characteristics of finite sized complex systems, seen in many real-world networks, are not studied in depth.

This thesis aimed to study the characteristics behind the evolution of finite sized complex networks, which can be seen in many real-world networks, such as relationships in community networks, transportation networks, computer networks, and wireless sensor networks, to name a few. Here, *finite sized networks* mean that such complex physical systems are not growing in size when the total number of nodes is concerned. One of the key reasons behind many complex network formations is the greedy optimal/near-optimal decision-based optimization of certain network parameters, such as minimizing the average path length. We also applied our observations from finite sized complex networks to design efficient finite sized real-world networks when reducing the end-to-end transmission delay and enhancing the average network flow capacity are concerned.

M.E. Thesis. Birla Institute of Technology Mesra, [Jun. 2011 – May 2012]

Title: Capacity enhancement in indoor wireless communication systems

This thesis aimed to analytically derive the closed-form expressions of the system capacity in the context of single-cell and multiple adjacent-cell wireless indoor environments. The closed-form expressions also considered the optimal power constraints into account for better evaluation of network system capacity. The singular value decomposition-based technique was also incorporated to introduce space as another degree of freedom to improve the system capacity further.

B.Tech. Project. Maulana Abul Kalam Azad University of Technology [Formerly West Bengal University of Technology], [Jan. 2007 – Apr. 2007]

Title: Design and development of code for radiation pattern measurement of microstrip antenna

This project aimed to develop a Matlab-based simulator to visualize the E-plane and H-plane radiation patterns at a given frequency when the cavity model of a particular microstrip antenna is considered. The length and width optimizations were also considered while designing the algorithm. Our developed algorithm is an approximation model that compares well with the IE3D-based simulation model.
